

Energy Audits for IPPC Licensing

*“It is not unreasonable for a company starting out in energy management to achieve a **20% reduction** or more in their energy bills by simple, good housekeeping measures alone.” – Sustainable Energy Ireland*

*An energy audit will identify a range of energy saving opportunities as well as **discharging your responsibilities under IPPC licensing.***

*Our **energy management services** include energy auditing and outsourced energy management to ensure our clients benefit from the saving opportunities identified in our audits.*

The first step to saving energy is to assess energy use and identify opportunities for saving energy. This best way to do this is to carry out an audit of energy use, developing performance metrics for your site, benchmarking energy use, and developing a list of specific energy saving projects.

At Energy Solutions, we have experience of energy auditing and energy management in a range of commercial and industrial sectors. This has been developed into a comprehensive Energy Management Service.

We will help you identify opportunities for improving the use of energy and deliver the business case and implementation plan to realise those savings.

At Energy Solutions, we believe that organisations and individuals who recognise the need to change will benefit, economically and ethically, by becoming part of the transition from a fossil fuel based, energy intensive economy to a more sustainable method of operation.

Following a period of relatively stable energy prices in the preceding decade and despite recent price reductions, energy costs have risen significantly in recent years and are rising again. Costs will increase again as carbon costs are included into energy costs through initiatives such as carbon taxes.
